

NCV7420

LIN Transceiver with 3.3 V or 5 V Voltage Regulation

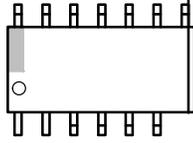

General Description

The NCV7420 is a fully featured local interconnect network (LIN) transceiver designed to interface between a LIN protocol controller and the physical bus. The transceiver is implemented in I3T technology enabling both high-voltage analog circuitry and digital functionality to co-exist on the same chip.

The NCV7420 LIN device is a member of the in-vehicle networking (IVN) transceiver family of ON Semiconductor that

TxD=LOW), the LIN transmitter is enabled only after TxD returns to HIGH. If STB pin is high during the standby-to-low slope mode transition, INH pin is pulled high. Otherwise, it stays floating.

Standby Mode

The standby mode is always entered after power-up of the NCV7420. It can also be entered from normal mode when the EN pin is low and the standby pin is high. From sleep

Definitions

All voltages are referenced to GND (Pin 11). Positive currents flow into the IC.
